Field personnel are referred to procedure FO.13, Containerization, Preserving, Handling, and Shipping of Soil and Water Samples for further details. Above-surface plant parts and coarse material (pebbles, rocks, and stones) will be removed by the sampling team. The soil samples will be classified according to precedure GT.1, Legging Alluvial and Bedrock Material. A visual description will be personally as the sample as they are being collected, using the Sample as they are being collected. Using the Sample as the visual description. The following the sample as the visual description. The

For surficial profiling samples, the sampler will collect representative samples, including organic material and coarse material. All sampling equipment will be protected from the ground surface with plastic sheeting.

4.1 SOIL SAMPLING WITH THE CDH METHOD

4.1.1 Introduction

The CDH sampler is one method for collecting soil samples for radionuclide analysis at the RFP. The CDH sampler was designed to sample radionuclides in the top-soil that could become resuspended in the air and thus pose a migration pathway by inhalation. The sampler is designed to obtain a sample from the upper surface 1/4 inch deep from an area 2 inches wide and 2 3/8 inches long, as shown in Figure GT.8-1.

Sampling locations will be described in the FSP. Some samples will be composited to obtain representative samples of large areas and others will be single-location samples. Sampling techniques for either type of sample are the same before compositing.

4.1.2 Equipment and Materials

The following is a list of equipment used for radionuclide contaminated soil sampling:

to pour the soil into the container. Brush any soil that adheres to the scoop into the sample container.

- 9. Close the container.
- After samples are placed in sample containers, the outside of the container will be wiped clean of excess material and it will be placed in a plastic bag.
- 11. Transfer the samples to the sample manager. Refer to procedure FO.13, Containerization, Preserving, Handling, and Shipping of Soil and Water Samples for the proper paperwork and sample transfer methods. This documentation is a QA record and must go into the ERM records center.
- 12. Either use another set of clean sampling equipment or decontaminate equipment after use and between sample locations. For specific decontamination guidelines, consult procedure FO.3, General Equipment Decontamination. Decontamination according to these procedures is not necessary between composite sample points; however, excess dirt or mud should be cleaned from the equipment.

Duplicate samples will be obtained by offsetting the primary sample location 6 inches to 2 feet upwind or in a direction technically more appropriate and placing the duplicate samples in a separate jar. The location of the duplicate will be documented on the data collection form. The duplicate sample will be composited and containerized following the same procedures as for the primary sample. The frequency of duplicate samples will be defined in the FSP or the Quality Assurance Addendum (QAA).

4.2 SOIL SAMPLING WITH THE RF METHOD (JIG AND SCOOP)

4.2.1 Introduction

The purpose of sampling is to determine the amount of accumulated plutonium that has been deposited on the ground and if corradio uclide contaminants lave teen deposited. This determination is accomplished by collecting a sample volume of 5,000 cm³ of soil in situ. The jig outlines a square area with 10-cm sides and is driven 5 cm into the soil to cut three sides of the sample (Figure GT.8-2). At the fourth side, soil is removed from outside the jig's perimeter. The scoop is used to finish the cut on both the fourth side of the sample and the bottom surface. Ten-Five samples should be collected at each location and composited.

4.2.3 Sampling Plot Layout

A site selection plan as described in the applicable FSP should be used to specify the general site location. The plan must provide adequate information for the sample collection crew to locate each specific site. Sample locations will be marked with an identification sign, as designated in the FSP, so that the area may be located and resampled at a later date. Permission to collect samples and mark the site should be obtained from the appropriate EG&G department or the landowner. Sample collection crews will be accompanied by supervision for all sampling activities to ensure that specified procedures are followed.

The following general site selection criteria should be considered:

- undisturbed location for the time interval of interest:
- near the center of a large, flat, open area;
- not subject to excessive runoff during heavy rain;
- light to moderate vegetation and permeable soil; and
- not in an area of mechanical disturbance.

Consideration of these criteria will depend on the nature of the study. For example, in some instances it may be necessary to investigate an area of mechanical disturbance.

If a sample site is not available that meets the criteria described in the FSP, the location can be moved up to one-half the distance to the next grid sample location or within 10 feet of a staked sample location which is not part of a grid. If the sample location must be moved further than this distance, regulatory agency concurrence will need to be obtained. Any movement of sample locations will be documented on the surface soil data collection form and in the field crew supervisors logbook.

All selected sites should be located on a map.

4.2.4 Procedures

Ten figures soil samples should be collected at each site and composited for analysis. Samples should be collected at the center and corners of two one meter equares that are spaced one meter apart one. Figure GT.8-3 illustrates this sample collection spacing. The following procedures will be used for the RF method:

12/8/93 or OR 28/94

Organization:
Environmental Restoration Management

- 1. Place the sampling jig on the ground, and using the wood block and hammer, drive the jig into the soil to a depth of 5 cm.
- With minimal disturbance to the soil inside the jig, use a scoop, trowel, or chisel to remove the soil from around the open side of the sample jig.
 Soil should be removed to a depth that will allow easy removal of the sample.
- Discard the soil removed from outside the jig.
- 4. State of the place it in a 10-mesh metal sieve that has a plastic bag attached to the bottom to receive the soil that passes through the sieve. To the receive the soil that passes through the sieve. To the receive the soil that passes through the sieve. To the receive the soil that passes through the sieve. To the receive the soil that passes through the sieve. To the receive the soil that passes through the sieve. To the receive the soil that passes through the sieve. After all 40 samples (5 samples from each—of the two—one 1-meter square templates) have been placed into the sieve, attach the sieve cover and seal with tape. Sieving may be done in stages if all 10-p soil samples cannot be placed into the sieve at the same time.
- 5. Label the sample container into which the soil sample is to be placed. Refer to procedure FO.13, Containerization, Preserving, Handling, and Shipping of Soil and Water Samples, for the type of information to be included on the label, and the appropriate type of container.

This documentation is a QA record and must go into the ERM records center.

Shake the sieve for several minutes. If the soil is moist, gently crush soil aggregate with fingers, while wearing proper personal protective equipment as prescribed in the applicable Health and Safety Plan, and continue shaking until all soil matrix has passed through the sieve. Discard large particles (cobbles, stones, etc.) that do not pass through the sieve into original disturbed area.

7. Place residual sieved seil from quartering inside plastic bag, and place bag inside another paint sen. If residual seil exceeds volume of one 1-gal paint can, place excess residual sieved seil back into original disturbed area. It is a selle to the control of the control o

- 8. Stere <u>residual</u> sieved seil for petential use at a later date.
- Decontaminate sieve between uses following procedure FO.3, General Equipment Decontamination.

4.3 GRAB SAMPLING (SPADE AND SCOOP)

4.3.1 introduction

Surface soil samples can be collected for radionuclide analyses using grab sampling (spade and scoop) methods.

Sampling locations and the number of soil samples will be described in the specific Field Sampling Plan for each project. Equipment, sample plot layout, and sampling procedures are described in the following sections.

4.3.2 Equipment and Materials

The following is a list of equipment for contaminated soil sampling:

- spade (long handle);
- stainless steel hand auger (optional);
- ** mason trowel:
- stainless steel scoop;
- stainless steel lab spoon;
- sample labels;
- sample containers:
- wash/rinse tubs;
- phosphate-free, laboratory-grade detergent (e.g., Liquinox);
- distilled water;
- plastic sheeting;
- sample locations (map and/or list);
- appropriate health and safety equipment as specified in the applicable Health and Safety Plan;
- photoionization detector (PID) or flame ionization detector (FID);
- logbook;
